Recent Hurricanes in The Gulf of Mexico

Hurricane Harvey
Category: 4
Year: 2017
Affected States: Texas,
Louisiana
Damage: \$125 Billion

Hurricane Laura
Category: 4
Year: 2020
Affected States:
Louisiana
Damage: \$19.1 Billion

Hurricane Delta
Category: 4
Year: 2020
Affected States:
Louisiana, Texas
Damage: \$3.09 Billion

Hurricane Ida
Category: 4
Year: 2021
Affected States: Louisiana,
Northeastern USA
Damage: \$65.25 Billion 2

Climate Change

The New York Times

These Maps Tell the Story of Two Americas: One Parched, One Soaked

By Aatish Bhatia and Nadja Popovich Aug. 24, 2021

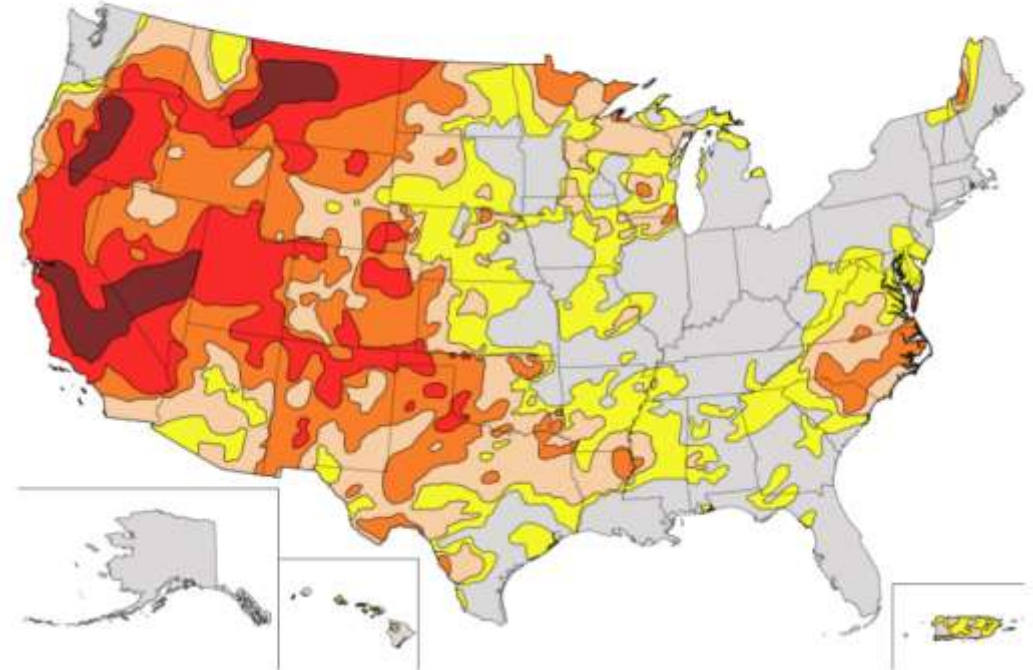

The country, like most of the world, is becoming both drier and wetter in the era of climate change. It depends where you live.

Change in annual average precipitation, in inches
In the last 30 years, compared to the 20th century

Temperature and Precipitation Variation Due to Climate Change

Rate of temperature change ($^{\circ}\text{F}$ per century):

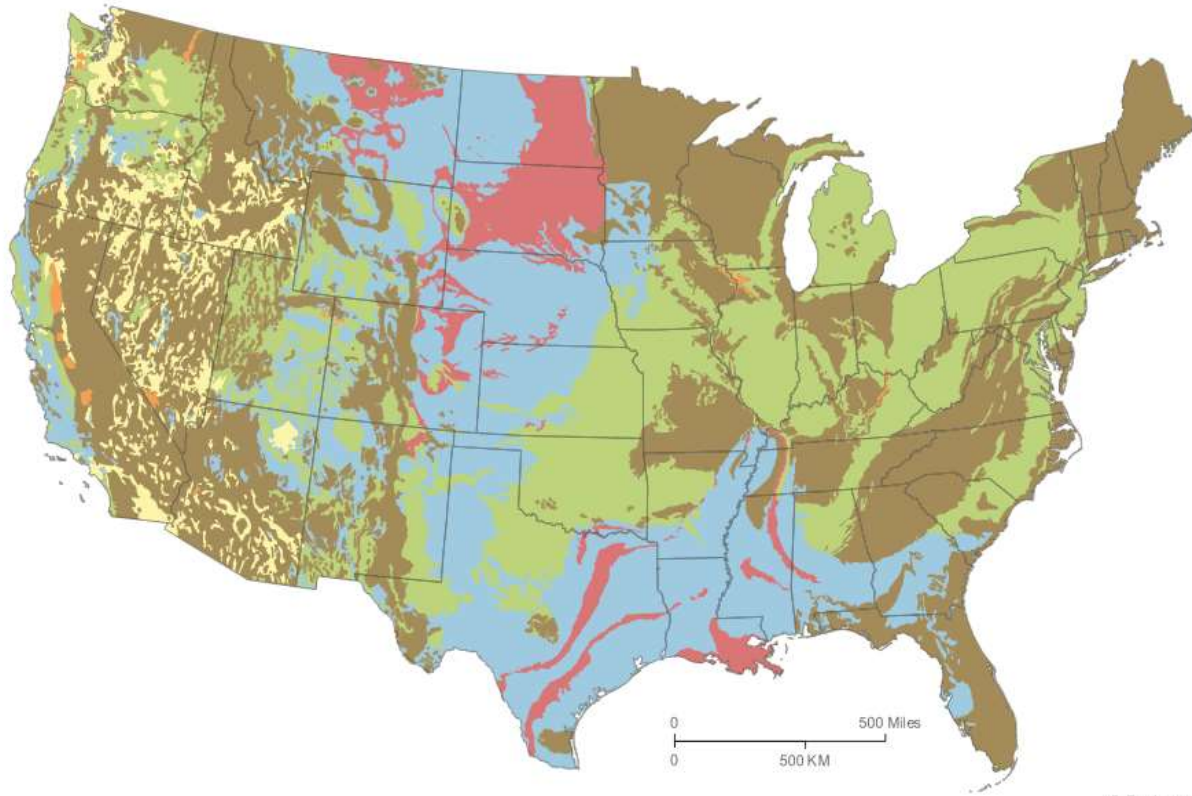

Gray interval: -0.1 to 0.1°F

Percent change in precipitation:

Expansive Soil

Legend:

Red: Clay having high swelling potential

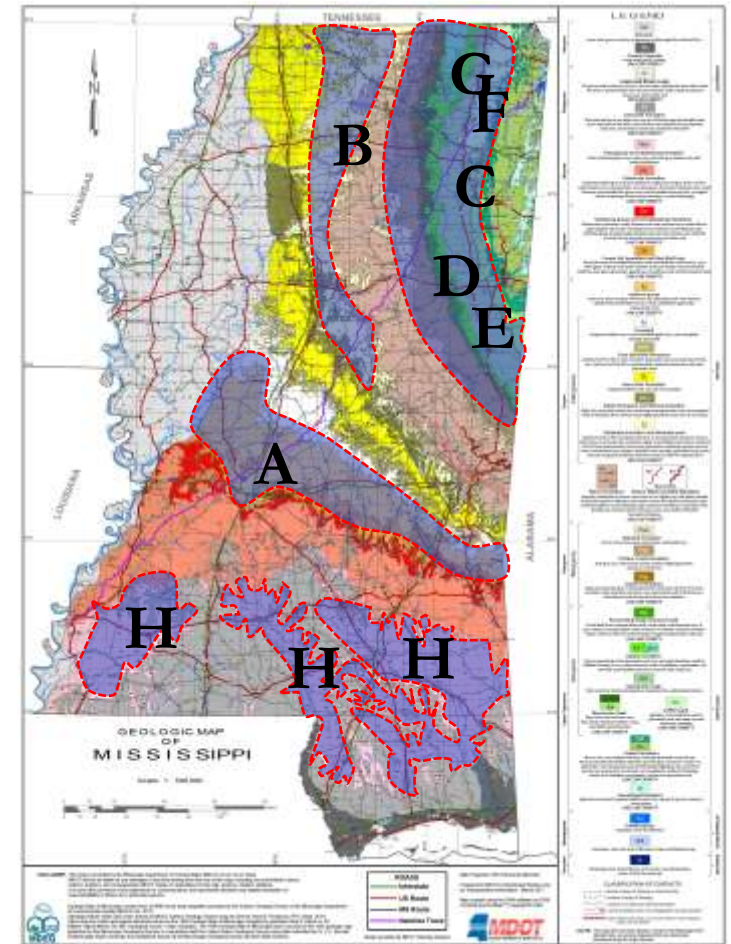

Blue: Less than 50% of clay contents having high swelling potential

Orange: Clay content having slight to moderate swelling potential

Green: Less than 50% of clay contents having slight to moderate swelling potential

Brown: Little or no swelling clay

Yellow: Insufficient data

A: Yazoo Clay Formation, B: Porters Creek Clay Formation C: Zilpha Formation, D: Prairie Bluff / Owl Creek Formation, E: Ripley Formation
F: Demopolis Chalk Formation, G: Mooreville Chalk Formation
H: Hattiesburg/Pascagoula Formation

Landslides on Expansive Soil

Sowell Road

Boundary boxes of the Jackson Formation, including Yazoo clay and its geological equivalents, in Mississippi, Alabama, and Louisiana (after USGS 2010).

Effect of Climatological Cycles on Landslides

Summer to Early Fall

The presence of desiccation cracks increases vertical permeability which increases infiltration and develops moisture build-up

End of Fall to Spring

As the soil gets wet, the desiccation cracks disappear which decreases infiltration. However, infiltrated water retained in the slope

Dynamic Data-Driven Applications Systems Framework

DDDAS framework to enable dynamically optimized 3D LiDAR sensing and TDA-based data processing for enhanced and efficient monitoring of earthen embankments

Data Segmentation and Preparation

Segment 3D point cloud data into two main regions: road and bank.

- **Method:** Use normal vectors and Gaussian curvature values for region segmentation.
- **Classification:** Classify points into green (embankment, Target of Interest) and blue (road) regions.
- **Purpose:** Focus analysis on the bank, filtering out road data for effective TDA evaluation, a global analysis approach.

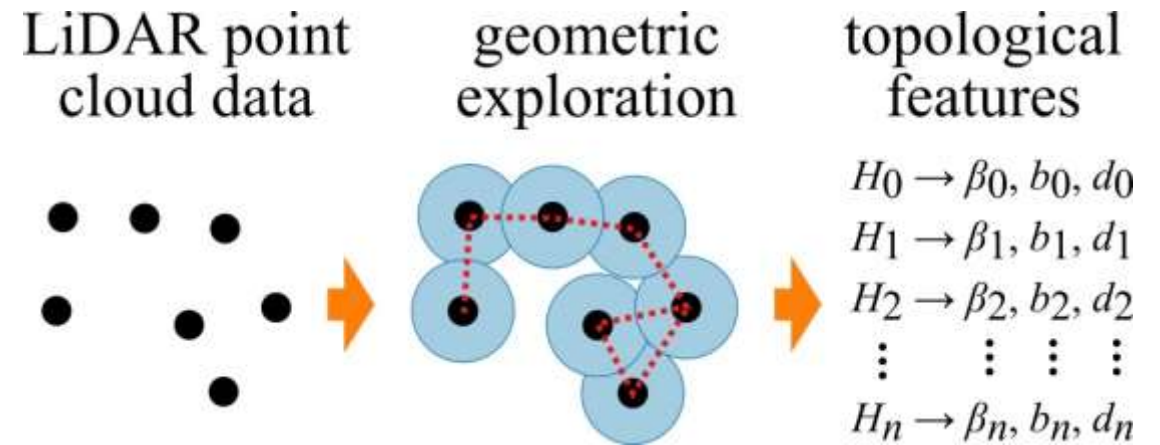

Segmented 3D point cloud data into road and bank regions.

Topological Data Analysis (TDA)

Overview: Captures local & global patterns in 3D LiDAR data.

- **Key Method:** Persistent Homology (PH) quantifies complex structures.
- **Applications:** Ideal for infrastructure monitoring.
- **Challenge:** High computational cost $O(n^3)$ by using Vietoris-Rips Persistence (VRP) algorithm.
- **Solution:** RANSAC (Random Sampling Consensus) Random sampling reduces compute time, and consensus to maintains data integrity.

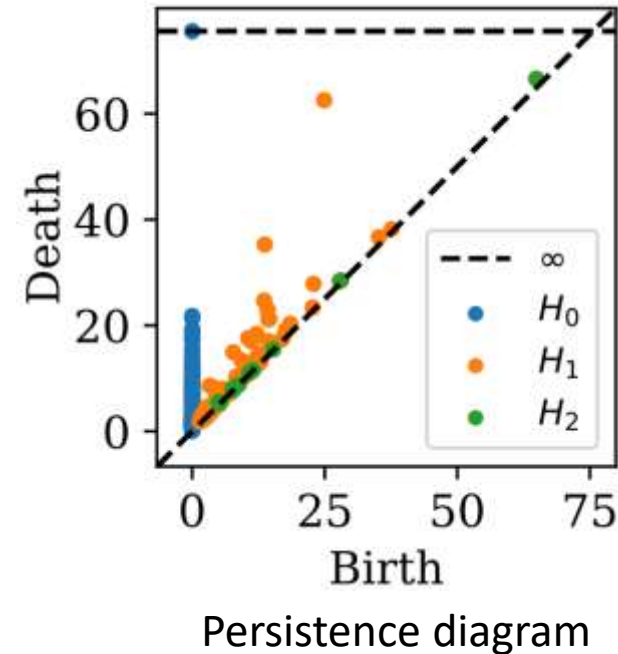

General TDA workflow for spatial data converted to features.

RANSAC (RANDOM SAMPLE CONSENSUS)-TDA

RANSAC-TDA Approach

- **Objective:** Reduce TDA computing load on large 3D point clouds.
- **Method:** Random sampling of 5,000 points; median of 10 repetitions for stability.
- **Metrics:** Persistence Entropy (PE) for H_0 and H_1 .
- **Advantages:** Efficient computation, effective for large datasets.

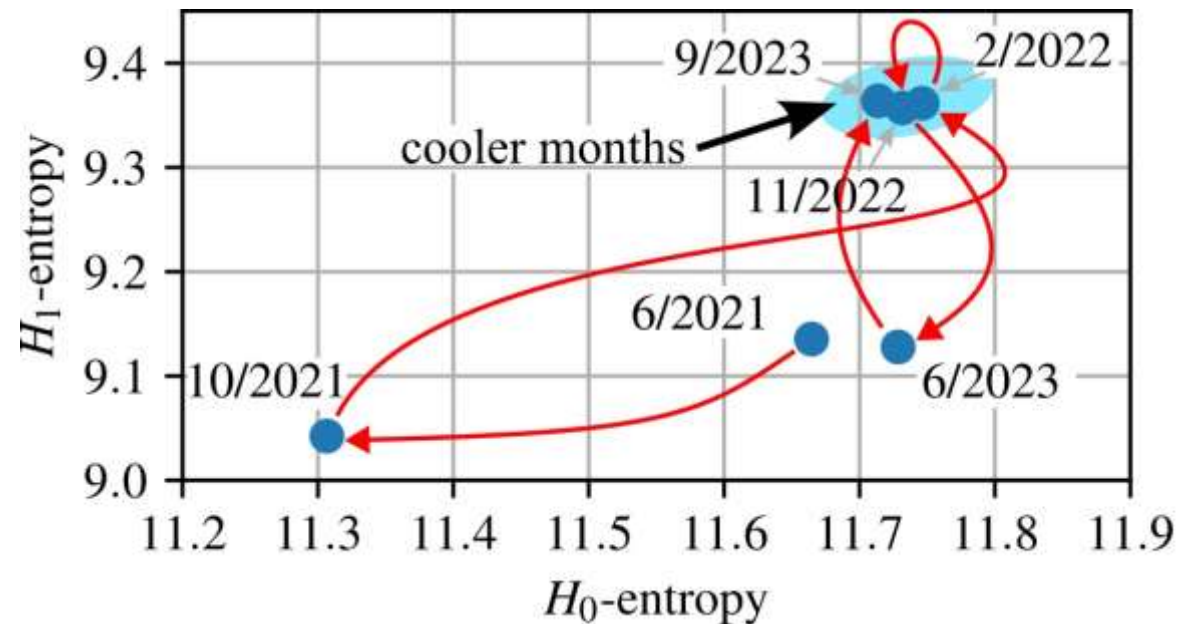

```
1: procedure RANSAC-TDA( $n$ )
2:   for K times do
3:     Randomly sample a subset  $m_i$  of 5000 points from point cloud  $n$ 
4:     Compute  $v_i = PE(m_i)$ 
5:   end for
6:   return median( $v_i$ )
7: end procedure
```

Pseudo code for the proposed RANSAC-TDA methodology

Results for Step 2: Wasserstein Distance

Dataset & RANSAC-TDA Results

- **SLiDE Dataset:** LiDAR scans (June 2021 - Sept 2023) with 20M points each.
- **Challenge:** High computation demand for TDA.
- **RANSAC-TDA Findings:**
 - **PE Analysis:** Detected slope deformations (H_0 , H_1 metrics).
 - **Seasonal Trends:** June 2023 showed moisture-related heaving; baseline return in cooler months.
- **Insights:** High sensitivity and efficient computation, with 69 sec per run.

Results for the TDA analysis in the H_1 and H_2 plane where the red arrow denotes the passage of time.
