Note Title

2013-11-07

{is zero (= @ [id, %0]) } enough

{is zero (= @ [id, %0] → = @ [id, %0];
= @ [id, %0]) }

→ This is an attempt to write a
comment where an expression
is more appropriate

A bad solution (in imperative style)
for `addvs`

```
{ addv (&+ @trans)}
```

```
{ length (!+ @2%.1)}
```

```
{ first-two ([1, 2])}
```

```
{ remaining (l@tl)}
```

```
{ addvs (while > @ [length, %1])}
```
