

# Assignment 1

The objective of this assignment is for you to become familiar with the Robot Operating System (ROS) software, which you will be using in future assignments to program various algorithms for robots.

## 1. Installing and learning ROS

ROS is officially supported on Ubuntu Linux ([www.ubuntu.com](http://www.ubuntu.com)), so if you would like to install ROS on your personal computer, we highly recommend that you install it alongside the version of Ubuntu, 16.04 LTS / **Xenial Xerus**. The following assume that you are installing ROS on Ubuntu.

Please follow these instructions to install ROS; you will want to install the ROS Kinetic Kame (ros-kinetic-desktop-full version).

The Ubuntu Linux computers in Swearingen should all have ROS kinetic installed already, so you may choose to use those machines to solve your assignments. Please notify us if you need a particular ROS package that is not installed on these machines. If you plan to use these computers for your assignments, you may skip to part 2.

Please follow the following instructions to install ROS:

<http://wiki.ros.org/kinetic/Installation/Ubuntu>

If you have sufficient hard drive space, ideally you should install ros-indigo-desktop-full version.

The previous ROS installation page is in fact the first item in a comprehensive tutorial on learning ROS. Please follow through all of the **Beginner level** tutorials on [this page](#). You may skip items 12 and 15, as we will not be using Python in this course. Read through the Intermediate Level tutorials 1 till 5.

## 2. Installing and learning ROS stage package

In the first few assignments we will be working with a simulated robot equipped with a horizontal sweeping laser scanner. Therefore, in addition to installing the core ROS packages, you will need to install the [stage robot simulator](#). Depending on what version of ROS you've installed previously, you may already have this stage package already. To find out, type the following in a terminal:

a) Install Stage, in case it is not available; e.g., for ROS Kinetic

**sudo apt-get install ros-kinetic-stage-ros**

b) Simulating one robot in Stage, following the tutorial starting from step 2

(<http://wiki.ros.org/stage/Tutorials/SimulatingOneRobot>).

c) For more in-depth understanding of Stage, taking a look at the other tutorials available

at <http://wiki.ros.org/stage/Tutorials>.

Keep in mind that you will need to execute `roscore`, `stageros`, `teleop_base`, and `rviz` simultaneously using separate terminals.

You will see two robots on the Stage window: a red square and a blue square. Your commands will affect the blue robot only.

### 3. Creating a random walk algorithm

Now that you are familiar with the fundamentals of ROS and the stage simulator, you will learn to create a simple ROS node that will drive the robot around, much like a Roomba robot vacuum cleaner. More specifically, the robot should move forward until it reaches an obstacle, then rotate in place for a random amount of time, then move forward again and repeat.

First type the following in a terminal: (for your own benefits, make sure you understand what each of these lines are doing)

```
> cd ~/catkin_ws/src
> catkin_create_pkg random_walk roscpp geometry_msgs sensor_msgs
> cd random_walk
```

Change the `CMakeLists.txt` by adding these lines:

```
include_directories(include ${catkin_INCLUDE_DIRS})
```

```
add_executable(random_walk src/random_walk.cpp)
```

```
target_link_libraries(random_walk ${catkin_LIBRARIES})
add_dependencies(random_walk beginner_tutorials_generate_messages_cpp)
```

```
add_executable(listener src/listener.cpp)
target_link_libraries(listener ${catkin_LIBRARIES})
add_dependencies(listener random_walk_generate_messages_cpp)
```

```
> touch src/random_walk.cpp
```

Now go into the random\_walk/src folder and paste the following code into random\_walk.cpp:

```
<random_walk.cpp>
```

To build and run this code, type the following in a terminal:

```
> catkin_make random_walk
> rosrn random_walk random_walk
```

You should start seeing range values being printed back to you in the terminal. If you use your mouse to drag the blue square robot in the Stage window, you will see the range values change.

Your task is now to implement a simple random walk algorithm: if the robot is moving sufficiently close to an obstacle in front of it, then rotate in-place for a specific duration; otherwise move forward by default. Do this by filling in the 3 sections labelled TODO in random\_walk.cpp.

When you copy paste from the pdf file, check for some letters that were mistranslated and generate syntax errors.

```
_____ <random_walk.cpp> _____

#include "ros/ros.h"
#include "geometry_msgs/Twist.h"
#include "sensor_msgs/LaserScan.h"
#include <cstdlib> // Needed for rand()
#include <ctime> // Needed to seed random number generator with a time value
```

```
class RandomWalk {
public:
    // Construst a new RandomWalk object and hook up this ROS node
    // to the simulated robot's velocity control and laser topics
    RandomWalk(ros::NodeHandle& nh) :
        fsm(FSM_MOVE_FORWARD),
        rotateStartTime(ros::Time::now()),
```

```

    rotateDuration(0.f) {
// Initialize random time generator
srand(time(NULL));

// Advertise a new publisher for the simulated robot's velocity command topic
// (the second argument indicates that if multiple command messages are in
// the queue to be sent, only the last command will be sent)
commandPub = nh.advertise<geometry_msgs::Twist>("cmd_vel", 1);

// Subscribe to the simulated robot's laser scan topic and tell ROS to call
// this->commandCallback() whenever a new message is published on that topic
laserSub = nh.subscribe("base_scan", 1, &RandomWalk::commandCallback, this);
};

// Send a velocity command
void move(double linearVelMPS, double angularVelRadPS) {
    geometry_msgs::Twist msg; // The default constructor will set all commands to 0
    msg.linear.x = linearVelMPS;
    msg.angular.z = angularVelRadPS;
    commandPub.publish(msg);
};

// Process the incoming laser scan message
void commandCallback(const sensor_msgs::LaserScan::ConstPtr& msg) {
    if (fsm == FSM_MOVE_FORWARD) {
        // Compute the average range value between MIN_SCAN_ANGLE and
        MAX_SCAN_ANGLE
        //
        // NOTE: ideally, the following loop should have additional checks to ensure
        // that indices are not out of bounds, by computing:
        //
        // - currAngle = msg->angle_min + msg->angle_increment*currIndex
        //
        // and then ensuring that currAngle <= msg->angle_max
        unsigned int minIndex = ceil((MIN_SCAN_ANGLE_RAD - msg->angle_min) / msg-
>angle_increment);
        unsigned int maxIndex = ceil((MAX_SCAN_ANGLE_RAD - msg->angle_min) / msg-
>angle_increment);
        float closestRange = msg->ranges[minIndex];
        for (unsigned int currIndex = minIndex + 1; currIndex < maxIndex; currIndex++) {
            if (msg->ranges[currIndex] < closestRange) {
                closestRange = msg->ranges[currIndex];
            }
        }
    }
}

```

```

    }
}
ROS_INFO_STREAM("Range: " << closestRange);

// TODO: if range is smaller than PROXIMITY_RANGE_M, update fsm and rotateStartTime,
// and also choose a reasonable rotateDuration (keeping in mind of the value
// of ROTATE_SPEED_RADPS)
//
// HINT: you can obtain the current time by calling:
//
// - ros::Time::now()
//
// HINT: you can set a ros::Duration by calling:
//
// - ros::Duration(DURATION_IN_SECONDS_FLOATING_POINT)
//
// HINT: you can generate a random number between 0 and 99 by calling:
//
// - rand() % 100
//
// see http://www.cplusplus.com/reference/clibrary/cstdlib/rand/ for more details
////////// ANSWER CODE BEGIN //////////

////////// ANSWER CODE END //////////

}
};

```

```

// Main FSM loop for ensuring that ROS messages are
// processed in a timely manner, and also for sending
// velocity controls to the simulated robot based on the FSM state
void spin() {
    ros::Rate rate(10); // Specify the FSM loop rate in Hz

    while (ros::ok()) { // Keep spinning loop until user presses Ctrl+C
        // TODO: Either call:
        //
        // - move(0, ROTATE_SPEED_RADPS); // Rotate right
        //
        // or
        //
        // - move(FORWARD_SPEED_MPS, 0); // Move forward
        //
        // depending on the FSM state; also change the FSM state when appropriate
    }
}

```
